shared Rust core: InvAcc = online softmax state (μ, z, y) + error bounds $(n, e_z, e_y, v_{\max})$
absorb / merge / remove; certified iff $B \le \tau_n$
PostgreSQL
SQLite
DuckDB
frame slides: MINVFUNC calls remove
frame slides: xInverse calls remove (cannot refuse)
no inverse in the C API: segment tree of partial states
certified: return state
not certified: return NULL
certified: append to frame shadow
not certified: flag refold
each frame = merge of $O(\log n)$ nodes; remove never called
executor restarts the frame (re-aggregates live rows)
xValue: extension refolds from its own frame shadow
online state (S2) suffices: nothing is subtracted
